

The week schools drew sharper AI lines.

Large systems restricted student-facing generative AI for younger learners, while ministries and universities moved ahead with AI literacy, teacher training, and workforce pathways.

NEW YORK CITY & LOS ANGELES · ANNOUNCED SEPTEMBER 2-7

The largest US districts move from experiments to guardrails.

New York City and Los Angeles, the two largest US school districts, restricted student use of generative AI tools this week. New York placed a one-year moratorium on student-facing AI from preschool through eighth grade, while LAUSD restricted access on school devices.

The significance is less that schools are banning tools outright and more that age, contracts, and assessment integrity are becoming the control points. [Axios](#), [Education Week](#), and [USA Today](#) framed the moves as part of a broader backlash against classroom tech, not just chatbots.

“

The center of gravity is shifting from “Should schools use AI?” to “Who gets access, at what age, and under whose supervision?”

Evidence keeps rewarding guided use, not shortcut use.

AI tutors can help with math — if they do not give away the answer.

University of Toronto Mississauga research suggests AI tutors can improve math learning when they force reasoning and withhold direct solutions.

Engagement is not learning.

The American Psychological Association warned that edtech engagement metrics should not be treated as proof of learning, especially when generative AI enables shallow completion.

Universities are redesigning assessment.

Academics worldwide are moving beyond AI detectors toward AI-resistant exams, oral defenses, and process-based proof of learning.

AI use is now nearly universal in some university cohorts.

A Plovdiv University survey found nearly 98% of students use AI, a signal that higher education is past the adoption question and into the integrity and pedagogy question.

What else moved this week.

 **BRAZIL** The National Education Council approved AI-use guidelines for schools and universities, including risk categories and limits on automated assessment. Porvir

 **MEXICO** SEP and UNESCO signed a letter of intent to support ethical AI, digital-device, and social-media policy in education. La Jornada

 **UAE** The UAE is rolling out an AI curriculum across public and private schools, paired with large-scale teacher training. Khaleej Times

 **JAPAN** The education ministry's curriculum draft would expand information education and embed AI across subjects, not only computing. The Mainichi

 **INDIA** Google is running nationwide AI training for educators in multiple Indian languages throughout September. Education Times

 **SINGAPORE** ITE and Singapore Polytechnic signed AI-ready built-environment skills MOUs with Nemetschek, covering digital twins and AI-assisted compliance. [TechNode Global](#)

 **AUSTRALIA** School leaders face an “AI strategy gap,” with only a fraction confident they have clear plans. [The Educator](#)

Platforms ship around practice, tutoring, and upskilling.

Google & Khan Academy expand Khanmigo.

Google.org fellows and Gemini added real-time interactive diagrams and a teacher-controlled practice builder for back-to-school 2026.

Duke Executive Education and Simplilearn move into agentic AI credentials.

Their new professional certificate covers applied generative AI and agentic AI for adult learners.

TMCnet

Three patterns to track.

Age-gating is hardening.

The US district moves, Norway comparisons, and UAE/Japan curriculum shifts all treat younger learners differently from older students.

Assessment is moving from detection to design.

Universities are redesigning tasks around process, oral defense, and demonstrated reasoning.

Teacher enablement is becoming infrastructure.

India, UAE, and platform providers are pairing AI rollout with educator training rather than assuming tools will self-adopt.
