SEPTEMBER 10, 2026

The day AI literacy became a trust gap.

Educators increasingly say they can teach AI. The harder question now is whether parents trust schools to use it for learning, not shortcuts.

SURVEY SIGNAL · K-12 TRUST

Educator confidence is rising. Parent confidence is the next test.

A new [Education Week](#) report on an IBM-commissioned Morning Consult survey found 83% of educators say they feel confident teaching about AI. That matters because the policy debate is quickly becoming an implementation debate: after months of bans, curriculum launches, and teacher-training announcements, systems now need adults who can

explain what students are doing, why it matters, and where the boundaries sit.

The unresolved question is parent trust. If parents see AI as shortcut technology, schools will struggle to move beyond defensive rules. If they see teachers using it to strengthen feedback, practice, accessibility, and AI literacy, the same tools become part of basic preparation for modern work.

“

The next bottleneck is not access to AI. It is whether families trust schools to teach with it responsibly.

Evidence keeps separating learning from activity.

AI tutors work best when they withhold answers.

University of Toronto Mississauga findings show math tutors help most when they force reasoning rather than reveal solutions.
