

The day unclear AI policy became the story.

After a week of safety standards, teacher guides, curriculum rollouts, and student restrictions, the biggest signal is that schools still do not have policies teachers can actually use.

1*Top story*

STANFORD AI INDEX · POLICY CLARITY

Only 6% of teachers say their school's AI policy is clear.

The Next Web reported a sharp finding from Stanford's AI Index education coverage: only 6% of teachers say their school's AI policy is clear, while four in five US students are using AI for schoolwork and about half of schools have no policy. The story also notes that adoption is accelerating outside the West.

That makes "policy clarity" the missing layer between ambition and practice. Teachers need usable answers: what is allowed, what must be

disclosed, what counts as learning evidence, and what data protections are guaranteed.

“

The problem is no longer whether AI has entered school. It is whether adults can explain the rules.

The evidence points to a policy-practice gap.

High use, low clarity.

Stanford's AI Index signal shows student use has outrun institutional guidance.

Professional certificates scale AI literacy.

Diembassy's AI Institute launched practical AI literacy credentials for working adults.

FinancialContent

Three patterns to track.

Policy clarity is the bottleneck.

Teachers cannot operationalize vague AI principles when students are already using the tools.

Safety standards may become procurement requirements.

Unions and schools are beginning to demand vendor accountability.

"Learning, not shortcuts" is becoming the shared frame.

Tutoring research, assessment redesign, and parent-trust debates now point to the same principle.
